The graph illustrates the trend of COVID-19 cases in the United States during the 2020 election period. The data shows a period of relative stability and low case counts from mid-October through November, which is interrupted by a massive surge in cases starting in late December. This surge occurs well after the final election date of December 14, suggesting it is not a direct result of the election itself but rather a continuation of the broader pandemic trend.

The graph displays the daily number of COVID-19 cases in the Netherlands from August 1, 2020, to December 31, 2020. The y-axis is labeled 'Number of cases' and ranges from 0 to 10,000 in increments of 2,000. The x-axis is labeled with the months 'Aug', 'Sep', 'Oct', 'Nov', and 'Dec'. Vertical dashed red lines are placed at the first of each month. The data points are connected by a dark red line. The number of cases starts at approximately 1,000 in August, remains relatively stable through September, and then drops sharply in early October to near zero. It stays at this low level through November and the first half of December, before rising sharply to over 10,000 cases in late December.

The graph illustrates the progression of COVID-19 cases in the Netherlands. It features a dark blue line with circular markers at each data point. The background is a light gray grid. Two vertical dashed red lines indicate the timing of the first and second national lockdowns. The first lockdown occurs in late October, coinciding with the start of the first major wave. The second lockdown occurs in late November, following a period of relative stability and a slight decline in cases. The second wave begins in late November and reaches its peak in early December.
