The graph illustrates the trend of COVID-19 cases in the United States during the 2020 election period. The data shows a period of relative stability and low case counts from mid-October through early December, which is interrupted by a massive surge in cases starting in late December. This surge occurs well after the final election results were announced, suggesting it is not a direct result of the election itself but rather a continuation of the broader pandemic trend.

The graph displays the daily number of COVID-19 cases in the Netherlands from August 1, 2020, to December 31, 2020. The y-axis represents the number of cases, with major grid lines every 20,000 units from 0 to 100,000. The x-axis shows the months from August to December. The data shows a period of low activity from August through early October, followed by a significant peak in early October reaching nearly 90,000 cases. After this peak, the number of cases returns to a low baseline and remains stable through November and the first half of December. A second, slightly higher peak occurs in the second half of December, reaching approximately 100,000 cases before declining again.

The graph illustrates the progression of COVID-19 cases in the Netherlands. It features a dark blue line with circular markers at each data point. The background is a light gray grid. Vertical dashed red lines are positioned at regular intervals, likely representing specific dates or weeks. The data shows a significant peak in late November, followed by a period of relative stability and then a second, even higher peak in early December.
